BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

IMAGES ARE BEST AVAILABLE COPY.

**As rescanning documents *will not* correct images,
please do not report the images to the
Image Problem Mailbox.**

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently amended) A system for ~~providing to a user printed~~ printing information ~~obtained~~ from a remote source, the system including

a first data storage device that is connectable to a network and stores first information;

a second data storage device that is connectable to a network and stores second information;

a printer that is connectable to the network, the printer being operable to print said first and second information and at least one identifier relating to the second information;

~~a user~~ an interface module that is provided by a first party to the user for interfacing the user with the source, the module being operatively arranged with respect to the printer and is responsive to the to permit a user requesting to request first information from the source for generating such that the printer generates a first printed medium that displays to the user carrying the first information together with second information derived from a second party;

~~identifier means for applying an identifier to the first printed medium such that designation of the identifier by the user results in the module generating a second printed medium that displays to the user third information; and the, or each, identifier, the interface module including a reader that is capable of reading the, or each, identifier to generate a request for the second information such that the printer generates a second printed medium carrying said second information; and~~

a calculation means being that is connectable to the network and is responsive to the module for determining a payment to be made by the a second party controlling the second data storage means to the a first party controlling the first data storage means.

2. (New) A system according to claim 1, in which the second data storage device stores third information relating to the second information, the second print medium

carrying at least one identifier, the interface module being capable of reading said at least one identifier to generate a request for the third information such that the printer generates a third printed medium carrying said third information

2
Rule 12.6
22. (Currently amended) A system according to claim 1, 2 including a plurality of printers and interface modules associated with corresponding users wherein the calculation means is responsive to the number of printed media generated that display at least one of: the first information; and the second information; and the third information.

3. (Cancelled)

4. (Currently amended) A system according to claim 2, 3 including account means for receiving the payment from the second party and for providing the payment to the first party.

5. (Currently amended) A system according to claim 4 wherein the account means is configured so that payment from the second party is a fixed amount for a predetermined period.

6. (Cancelled)

7. (Currently amended) A system according to claim 6, 1 wherein the calculation means is responsive to the monetary value of the purchases completed by the users for determining the payment.

8. - 9. (Cancelled)

10. (Currently amended) A system according to claim 1, 2 wherein the or each identifier is a at least one tag.

11. (Currently amended) A system according to claim 10 wherein the, or each identifier is a plurality of tags spaced apart on the respective printed medium.

12. (Currently amended) A system according to claim ~~1~~ 2 wherein the identifier is a character string that the user provides to the module to obtain the ~~third~~ second information.

13. (Original) A system according to claim 12 wherein the string includes a sequence of numbers that are manually keyed into the module.

14. (Currently amended) A system according to claim 12 wherein the string is configured to be scanned by sensor means ~~that are manually operated by the user.~~

15. (Currently amended) A system according to claim 4 wherein the account means ~~generates~~ is configured to generate a disable signal if the payment calculated as payable by the second party is not paid within a predetermined time, ~~the generation of the disable signal preventing the module obtaining the first or the second information.~~

16. – 17. (Cancelled)

18. (Currently amended) A system according to claim ~~1~~ 3 wherein the second information is a link to a third party and the identifier is related to that information such that designation by the user of the second information results in designation of the identifier which, in turn, ensures that the third information includes either or both of further information about the goods and/or services being offered for use and/or sale by the third party or instructions as to how the user should proceed to effect that use and/or a purchase of those goods and/or services of the third party.

19. – 25. (Cancelled)

26. (Currently amended) A system for providing ~~to a user~~ printed information obtained from a remote computer source, the system including:

a first data storage device that is connectable to a network and stores first information;

a second data storage device that is connectable to the network and stores second information;

a user printer module that is provided by a first party to the user for interfacing the user with the source connectable to the network, the printer being operable to print said first and second information and at least one identifier relating to the second information;

the an interface module being responsive to the user requesting that is operatively arranged with respect to the printer to permit a user to request first information from the source for generating such that the printer generates a first printed medium that displays to the user carrying the first information together with second information derived from a second party;

an identifier device for applying an identifier to the first printed medium such that designation of the identifier by the user results in the module generating a second printed medium that displays to the user third information; and the, or each, identifier, the interface module being configured to read the, or each identifier to generate a request for the second information such that the printer generates a second printed medium carrying said second information; and

an account computer being that is connectable to the network and is responsive to at least one of the module and/or the remote computer source, the first data storage device and the second data storage device for determining a payment to be made by the second party to the first party.

27. - 29. (Cancelled)

30. (Currently amended) A system according to claim 29 wherein the printer is configured to print the identifier is printed with ink that does not substantially reflect light in the visible spectrum.

31. (Currently amended) A method for providing ~~to a user~~ printed information obtained from a remote source, the method including the steps of:

interfacing the user with ~~the source~~ a first data storage device in which first information is stored and a second data storage device in which second information is stored, both devices being connectable to a network via a ~~user module~~ printer that is connectable to the network and that is provided by a first party to the user, the ~~module~~ printer being responsive to the user requesting first information from the ~~source~~ for generating first data storage device to generate a first printed medium that displays to the user the first information together with the second information derived from a second party;

applying an identifier to the first printed medium ~~with identifier means~~ such that designation of the identifier by the user results in the module generating a second printed medium that displays to the user third information; and

~~being responsive to the module with calculation means for determining~~ calculating a payment to be made by the second party to the first party.

32. (Currently amended) A method according to claim 31 ~~including a plurality of modules associated with corresponding users including in which~~ the further step of the ~~calculation means being responsive to~~ calculating the payment to be made is based on the number of printed medium generated that display one of: the first information; the second information; and the third information.

33. (Currently amended) A method according to claim 32 ~~including in which~~ the further step of the ~~calculation means being responsive to~~ calculating the payment to be made is based on the number of printed medium generated that display two or more of: the first information; the second information; and the third information.

34. (Currently amended) A method according to claim 32 ~~including account means, the method including which includes~~ the step of the ~~account means~~ receiving the payment from the second party and for providing the payment to the first party.

35. - 36. (Cancelled)

37. A method according to claim 36 ~~including 31 in which~~ the step of the calculation ~~means being responsive to calculating the payment to be made is based on~~ the monetary value of the purchases completed by the users ~~for determining the payment.~~

38. – 44. (Cancelled)

45. (Currently amended) A method according to claim 44 ~~wherein the account means generates 31, which includes the step of generating~~ a disable signal if the payment from the second party is not settled within a predetermined time, the generation of the disable signal preventing the module obtaining the first or the second information.

46. – 55. (Cancelled)

56. (Currently amended) A method for providing ~~to a user~~ printed information ~~obtained~~ from a remote computer source, the method including the steps of:

interfacing the a user with the source a first data storage device containing first information and connected to a network and a second data storage device containing second information and connected to the network via a user printer module that is provided to the user by a first party, the module being responsive to the user requesting the first information from the source first data storage device for generating a first printed medium that displays ~~to the user~~ the first information together with the second information derived from a second party;

applying an identifier to the first printed medium with an identifier device such that designation of the identifier by the user results in the module generating a second printed medium that displays to the user third information; and

~~being responsive to the module and/or the remote computer source with an account computer for determining a payment to be made by the second party to the first party.~~

57. – 60. (Cancelled)
